

FLY SPRAY

Summer or Sweet Itch is often associated with flies and/or dry skin. We recommend treating when you start seeing the flies and gnats because once there is an open or scraped area, we recommend a different treatment (Therapy Instructions). Many horses have very sensitive skin, so it is always a good policy to try these products on a small area 24 hours prior to treating entire body.

In a large spray bottle combine 2 TBSP **Lemon conditioner** and 1 TBSP **Productive Shield Conditioner**. Dilute 1:8 or 1:10 and spray on areas of concern. If heavy sweating, rinse before applying the fly spray.

“TICK” HYDRATION SPRAY

“We have been having extremely bad “tick seasons” in Massachusetts. There is nothing on the market for Equines and ticks. I was finding around 20 attached ticks a day on one of my horses (he’s a magnet) and needed to try something. The first day after the spray I only found one tick. Nothing is 100% but I found this is the best thing yet and the results kept coming! With my dogs I would find a few a week attached and went down to one or none. My sister had the same results with her dog.” - Tish Thorpe, CPAe, CPACP

1/4 cup **Protective Shield Conditioner**
1/4 cup **Fruit of the Groomer Mint PEK**
32 oz H2O
Spray bottle

Put the first application over the body, legs & head. Then daily to the legs and head/face (where the ticks crawl on). If it rains, apply all over the body, legs and head again.
